Manuka Natural Health Ltd

We are New Zealand based whole sale suppliers with dedicated team of professionals focused on exporting the best products the country has to offer. Our team comprises of professionals from various backgrounds bringing in vast experience across borders. Our professional dedicated team has expertise in both domestic and international trade making our products recognized worldwide.

Monofloral Honey

Manuka Honey is a monofloral honey – it is from the nectar of one very special plant species grown only in New Zealand called *Leptospermum scoparium*, also locally known as Manuka tree. The bioactivity of Manuka Honey known as the Unique Manuka Factor (UMF) is closely associated with a range of therapeutic properties.

What does UMF Stand For?

“Unique Manuka Factor” – this is the name given to the form of a bacterial activity found in some Manuka Honey which was discovered by Dr. Peter Molan (MBE) at Waikato University’s Honey research unit. Most honey has some activity in part due to the formation of hydrogen peroxide. UMF activity is due to other natural phytochemicals present in the honey.

How is the UMF activity tested?

The hydrogen peroxide activity of the honey is neutralized with the addition of enzyme catalyst. The antimicrobial activity of the honey against staphylococcus aureus is then tested and compared to a known antiseptic agent – phenol.

The test protocol was developed by Dr. Peter Molan.

MANUKA HONEY

What does the UMF Number mean?

The number after the letters UMF represents the level of antibacterial activity of the honey against staphylococcus aureus as a percentage phenol concentration i.e., East Cape UMF15+ Active Manuka Honey has been certified to have an antibacterial effect better than a 15% phenol solution.

Why is UMF Active Manuka Honey preferred to other Manuka Honey?

UMF is the only Manuka Honey which has been tested and certified to have a specific level of antibacterial activity. UMF Manuka Honey is more effective against some bacteria such as staphylococcus aureus, a common cause of infected wounds and streptococcus pyogenes which cause sore throats. UMF activity is very stable and is not adversely affected by heat and light during storage where hydrogen peroxide activity can be. UMF activity is not adversely affected by the catalase enzyme that is present in the tissues and serum of the body.

NEW ZEALAND

The East Cape

The East Cape is renowned for its bush covered hills, its clean fast flowing streams and the rugged and natural beauty of its unspoilt coastline. The land on which the wild Manuka plantations grow is free of chemicals and modern day pollutions. The high triketone East Cape variety of Manuka Honey has been proven to contain the most highly active anti microbial essential oils of any Manuka variety in the world. This Unique variety of Manuka is found on the East Cape.

Wild Harvest Manuka Honey is processed in a manner which ensures that both the peroxide and non-peroxide activity are retained. The honey is finely filtered to ensure that any foreign matter is removed from the honey. The Pollution-free, natural east coast environment together with the care and attention to quality during the UMF honey processing ensures that Wild Harvest Manuka Honey is of the highest quality available.

UMF 5+

UMF5+ Active Manuka Honey can be enjoyed as a spread, used in cooking or as a sweetener for herbal teas and other drinks. It has been tested and certified to have the special antibacterial activity (UMF) greater than 5.

UNIQUE MANUKA FACTOR
HONEY ASSOCIATION

UMF10+

UMF10+ Active Manuka Honey can be enjoyed as a spread as a sweetener for herbal teas and other drinks or taken daily to help promote general good health. It has been tested and certified to have the special antibacterial activity (UMF) greater than 10.

UMF15+

UMF15+ Active Manuka Honey is selected for its high levels of non-peroxide activity (UMF>15). It can be taken to help soothe sore throats and indigestion and or take a teaspoon two or three times daily before meals to help promote general good health. It can also be used externally on the skin.

UMF20+

UMF20+ Active Manuka Honey is specifically selected for its high levels of non-peroxide activity (>20). Activity of this level is only found in a very small portion of Manuka Honey. This very special honey can be taken to help soothe sore throats and indigestion and taken two or three times daily before meals to help support the body's own immune system. It can also be externally used on the skin.
